SUBSTITUTED AROMATIC COMPOUNDS AS c.AMP PHOSPHODIESTERASE- AND TNF-INHIBITORS

Field of the Invention

This invention is directed to substituted aromatic compounds, their preparation, pharmaceutical compositions containing these compounds, and
5 their pharmaceutical use in the treatment of disease states associated with proteins that mediate cellular activity.

Disease states associated with abnormally high physiological levels of cytokines such as TNF are treatable according to the invention. TNF is an important pro-inflammatory cytokine which causes hemorrhagic necrosis of
10 tumors and possesses other important biological activities. TNF is released by activated macrophages, activated T-lymphocytes, natural killer cells, mast cells and basophils, fibroblasts, endothelial cells and brain astrocytes among other cells.

The principal in vivo actions of TNF can be broadly classified as
15 inflammatory and catabolic. It has been implicated as a mediator of endotoxic shock, inflammation of joints and of the airways, immune deficiency states, allograft rejection, and in the cachexia associated with malignant disease and some parasitic infections. In view of the association of high serum levels of TNF with poor prognosis in sepsis, graft versus host disease and acute
20 respiratory distress syndrome, and its role in many other immunologic processes, this factor is regarded as an important mediator of general inflammation.

TNF primes or activates neutrophils, eosinophils, fibroblasts and endothelial cells to release tissue damaging mediators. TNF also activates
25 monocytes, macrophages and T-lymphocytes to cause the production of colony stimulating factors and other pro-inflammatory cytokines such IL₁, IL₆, IL₈ and GM-CSF, which in some cases mediate the end effects of TNF. The ability of TNF to activate T-lymphocytes, monocytes, macrophages and related cells has been implicated in the progression of Human Immunodeficiency Virus (HIV)
30 infection. In order for these cells to become infected with HIV and for HIV replication to take place, the cells must be maintained in an activated state. Cytokines such as TNF have been shown to activate HIV replication in monocytes and macrophages. Features of endotoxic shock such as fever, metabolic acidosis, hypotension and intravascular coagulation are thought to
35 be mediated through the actions of TNF on the hypothalamus and in reducing the anti-coagulant activity of vascular endothelial cells. The cachexia associated with certain disease states is mediated through indirect effects on

- 2 -

protein catabolism. TNF also promotes bone resorption and acute phase protein synthesis.

The discussion herein relates to disease states associated with TNF and includes those disease states related to the production of TNF itself, and
5 disease states associated with other cytokines, such as but not limited to IL-1, or IL-6, that are modulated by associated with TNF. For example, a IL-1 associated disease state, where IL-1 production or action is exacerbated or secreted in response to TNF, would therefore be considered a disease state associated with TNF. TNF- α and TNF- β are also herein referred to collectively
10 as "TNF" unless specifically delineated otherwise, since there is a close structural homology between TNF- α (cachectin) and TNF- β (lymphotoxin) and each of them has a capacity to induce similar biologic responses and bind to the same cellular receptor.

Disease states associated with pathological conditions that are
15 modulated by inhibiting enzymes, which are associated with secondary cellular messengers, such as cyclic AMP phosphodiesterase are also treatable according to the invention. Cyclic AMP phosphodiesterase is an important enzyme which regulates cyclic AMP levels and in turn thereby regulates other important biological reactions. The ability to regulate cyclic AMP
20 phosphodiesterase, including type IV cyclic AMP phosphodiesterase, therefore, has been implicated as being capable of treating assorted biological conditions.

In particular, inhibitors of type IV cyclic AMP phosphodiesterase have been implicated as being bronchodilators and asthma-prophylactic agents and
25 as agents for inhibiting eosinophil accumulation and of the function of eosinophils, and for treating other diseases and conditions characterized by, or having an etiology involving, morbid eosinophil accumulation. Inhibitors of cyclic AMP phosphodiesterase are also implicated in treating inflammatory diseases, proliferative skin diseases and conditions associated with cerebral
30 metabolic inhibition.

It will be apparent to those skilled in the art that compounds of the present invention may contain asymmetric centers. These asymmetric centers may independently be in either the R or S configuration. It will also be
30 apparent to those skilled in the art that certain compounds of the invention may also exhibit geometrical isomerism. The present invention comprises the individual geometrical isomers and stereoisomers and mixtures thereof.

Such isomers can be separated from their mixtures, by the application or adaptation of known methods, for example chromatographic techniques and
35 recrystallization techniques, or they are separately prepared from the appropriate isomers of their intermediates, for example by the application or adaptation of methods described herein.

The compounds of the present invention are useful in the form of the free base or acid or in the form of a pharmaceutically acceptable salt thereof. All forms are within the scope of the invention.

Where the compound of the present invention is substituted with a basic moiety, acid addition salts are formed and are simply a more convenient form for use; and in practice, use of the salt form inherently amounts to use of the free base form. The acids which can be used to prepare the acid addition salts include preferably those which produce, when combined with the free base, pharmaceutically acceptable salts, that is, salts whose anions are non-toxic to the patient in pharmaceutical doses of the salts, so that the beneficial inhibitory effects on TNF and PDE inherent in the free base are not vitiated by side effects ascribable to the anions. Although pharmaceutically acceptable salts of said basic compounds are preferred, all acid addition salts are useful as sources of the free base form even if the particular salt, per se, is desired only as an intermediate product as, for example, when the salt is formed only for purposes of purification, and identification, or when it is used as intermediate in preparing a pharmaceutically acceptable salt by ion exchange procedures. Pharmaceutically acceptable salts within the scope of the invention are those derived from the following acids: mineral acids such as hydrochloric acid, sulfuric acid, phosphoric acid and sulfamic acid; and organic acids such as acetic acid, citric acid, lactic acid, tartaric acid, malonic acid, methanesulfonic acid, ethanesulfonic acid, benzenesulfonic acid, p-toluenesulfonic acid, cyclohexylsulfamic acid, quinic acid, and the like. The corresponding acid addition salts comprise the following: hydrohalides, e.g. hydrochloride and hydrobromide, sulfate, phosphate, nitrate, sulfamate, acetate, citrate, lactate, tartarate, malonate, oxalate, salicylate, propionate, succinate, fumarate, maleate, methylene-bis- β -hydroxynaphthoates, gentisates, mesylates, isethionates and di-p-toluoyltartratesmethanesulfonate, ethanesulfonate, benzenesulfonate, p-toluenesulfonate, cyclohexylsulfamate and quinate, respectively.

According to a further feature of the invention, acid addition salts of the compounds of this invention are prepared by reaction of the free base with the appropriate acid, by the application or adaptation of known methods. For example, the acid addition salts of the compounds of this invention are prepared either by dissolving the free base in aqueous or aqueous-alcohol solution or other suitable solvents containing the appropriate acid and isolating the salt by evaporating the solution, or by reacting the free base and acid in an

organic solvent, in which case the salt separates directly or can be obtained by concentration of the solution.

The acid addition salts of the compounds of this invention can be regenerated from the salts by the application or adaptation of known methods.

- 5 For example, parent compounds of the invention can be regenerated from their acid addition salts by treatment with an alkali, e.g. aqueous sodium bicarbonate solution or aqueous ammonia solution.

- Where the compound of the invention is substituted with an acidic moiety, base addition salts may be formed and are simply a more convenient
1 0 form for use; and in practice, use of the salt form inherently amounts to use of the free acid form. The bases which can be used to prepare the base addition salts include preferably those which produce, when combined with the free acid, pharmaceutically acceptable salts, that is, salts whose cations are non-toxic to the animal organism in pharmaceutical doses of the salts, so that the
1 5 beneficial inhibitory effects on TNF and PDE inherent in the free acid are not vitiated by side effects ascribable to the cations. Pharmaceutically acceptable salts, including for example alkali and alkaline earth metal salts, within the scope of the invention are those derived from the following bases: sodium hydride, sodium hydroxide, potassium hydroxide, calcium hydroxide, aluminum
2 0 hydroxide, lithium hydroxide, magnesium hydroxide, zinc hydroxide, ammonia, ethylenediamine, N-methyl-glucamine, lysine, arginine, ornithine, choline, N,N'-dibenzylethylenediamine, chlorprocaine, diethanolamine, procaine, N-benzylphenethylamine, diethylamine, piperazine, tris(hydroxymethyl)-aminomethane, tetramethylammonium hydroxide, and the like.

- 2 5 Metal salts of compounds of the present invention may be obtained by contacting a hydride, hydroxide, carbonate or similar reactive compound of the chosen metal in an aqueous or organic solvent with the free acid form of the compound. The aqueous solvent employed may be water or it may be a mixture of water with an organic solvent, preferably an alcohol such as
3 0 methanol or ethanol, a ketone such as acetone, an aliphatic ether such as tetrahydrofuran, or an ester such as ethyl acetate. Such reactions are normally conducted at ambient temperature but they may, if desired, be conducted with heating.

- 3 5 Amine salts of compounds of the present invention may be obtained by contacting an amine in an aqueous or organic solvent with the free acid form of the compound. Suitable aqueous solvents include water and mixtures of water with alcohols such as methanol or ethanol, ethers such as tetrahydrofuran,

- 41 -

nitriles such as acetonitrile, or ketones such as acetone. Amino acid salts may be similarly prepared.

The base addition salts of the compounds of this invention can be regenerated from the salts by the application or adaptation of known methods.

- 5 For example, parent compounds of the invention can be regenerated from their base addition salts by treatment with an acid, e.g. hydrochloric acid.

As will be self-evident to those skilled in the art, some of the compounds of this invention do not form stable salts. However, acid addition salts are most likely to be formed by compounds of this invention wherein R^3 represents a
1 0 nitrogen-containing heteroaryl group and/or wherein R^3 contains an amino group as a substituent. Preferable acid addition salts of the compounds of the invention are those wherein R^2 is other than an acid labile group.

As well as being useful in themselves as active compounds, salts of compounds of the invention are useful for the purposes of purification of the
1 5 compounds, for example by exploitation of the solubility differences between the salts and the parent compounds, side products and/or starting materials by techniques well known to those skilled in the art.

It will be apparent to those skilled in the art that certain compounds of formula I can exhibit isomerism, for example geometrical isomerism and optical
2 0 isomerism. Geometrical isomers include the cis and trans forms of compounds of the invention having alkenyl or diazenyl moieties. All isomers within formula I, and their mixtures, are within the scope of the invention.

Such isomers can be separated from their mixtures, by the application or adaptation of known methods, for example chromatographic techniques and
2 5 recrystallization techniques, or they are separately prepared from the appropriate isomers of their intermediates, for example by the application or adaptation of methods described herein.

The starting materials and intermediates are prepared by the application or adaptation of known methods, for example methods as described in the
3 0 Reference Examples or their obvious chemical equivalents.

15 involving, morbid eosinophil accumulation. As further examples of conditions which can be ameliorated by the administration of inhibitors of cyclic AMP phosphodiesterase such as compounds of formula I there may be mentioned inflammatory diseases, such as atopic dermatitis, urticaria, allergic rhinitis, psoriasis, rheumatic arthritis, ulcerative colitis, Crohn's disease, adult
20 respiratory distress syndrome and diabetes insipidus, other proliferative skin diseases such as keratosis and various types of dermatitis, conditions associated with cerebral metabolic inhibition, such as cerebral senility, multi-infarct dementia, senile dementia (Alzheimer's disease), and memory impairment associated with Parkinson's disease, and conditions ameliorated
25 by neuroprotectant activity, such as cardiac arrest, stroke, and intermittent claudication. A special embodiment of the therapeutic methods of the present invention is the treating of asthma.

The compounds are also inhibitors of tumor necrosis factor, especially $\text{TNF-}\alpha$. Thus, the present invention provides compounds of formula I, and
30 compositions containing compounds of formula I, which are of use in a method for treating a patient suffering from, or subject to, conditions which can be ameliorated by the administration of an inhibitor of $\text{TNF-}\alpha$. For example compounds of the present invention are useful in joint inflammation, arthritis, rheumatoid arthritis and other arthritic conditions such as rheumatoid
35 spondylitis and osteoarthritis. Additionally, the compounds are useful in treatment of sepsis, septic shock, gram negative sepsis, toxic shock syndrome, acute respiratory distress syndrome, asthma and other chronic pulmonary

Furthermore, the compounds are useful in the treatment of infections such as viral infections and parasitic infections, for example malaria such as cerebral malaria, fever and myalgias due to infection, HIV, AIDS, cachexia such as cachexia secondary to AIDS or to cancer. Other disease states that may be treated with the compounds of the present invention include Crohn's disease, ulcerative colitis, pyresis, systemic lupus erythematosus, multiple sclerosis, type I diabetes mellitus, psoriasis, Beçhet's disease, anaphylactoid purpura nephritis, chronic glomerulonephritis, inflammatory bowel disease and leukemia. A special embodiment of the therapeutic methods of the present invention is the treating of joint inflammation.

According to a further feature of the invention there is provided a method for the treatment of a human or animal patient suffering from, or subject to, conditions which can be ameliorated by the administration of an inhibitor of cyclic AMP phosphodiesterase or of TNF, especially TNF- α , for example conditions as hereinbefore described, which comprises the administration to the patient of an effective amount of compound of formula I or a composition containing a compound of formula I. "Effective amount" is meant to describe an amount of compound of the present invention effective in inhibiting cyclic AMP phosphodiesterase and/or TNF and thus producing the desired therapeutic effect.

The present invention also includes within its scope pharmaceutical formulations which comprise at least one of the compounds of formula I in association with a pharmaceutically acceptable carrier or coating.

In practice compounds of the present invention may generally be administered parenterally, rectally or orally, but they are preferably administered by inhalation.

The products according to the invention may be presented in forms permitting administration by the most suitable route and the invention also relates to pharmaceutical compositions containing at least one product according to the invention which are suitable for use in human or veterinary medicine. These compositions may be prepared according to the customary methods, using one or more pharmaceutically acceptable adjuvants or excipients. The adjuvants comprise, inter alia, diluents, sterile aqueous media and the various non-toxic organic solvents. The compositions may be presented in the form of tablets, pills, granules, powders, aqueous solutions or

suspensions, injectable solutions, elixirs or syrups, and can contain one or more agents chosen from the group comprising sweeteners, flavorings, colorings, or stabilizers in order to obtain pharmaceutically acceptable preparations.

- 5 The choice of vehicle and the content of active substance in the vehicle are generally determined in accordance with the solubility and chemical properties of the product, the particular mode of administration and the provisions to be observed in pharmaceutical practice. For example, excipients such as lactose, sodium citrate, calcium carbonate, dicalcium phosphate and
10 disintegrating agents such as starch, alginic acids and certain complex silica gels combined with lubricants such as magnesium stearate, sodium lauryl sulfate and talc may be used for preparing tablets. To prepare a capsule, it is advantageous to use lactose and high molecular weight polyethylene glycols. When aqueous suspensions are used they can contain emulsifying agents or
15 agents which facilitate suspension. Diluents such as sucrose, ethanol, polyethylene glycol, propylene glycol, glycerol and chloroform or mixtures thereof may also be used.

- For parenteral administration, emulsions, suspensions or solutions of the products according to the invention in vegetable oil, for example sesame
20 oil, groundnut oil or olive oil, or aqueous-organic solutions such as water and propylene glycol, injectable organic esters such as ethyl oleate, as well as sterile aqueous solutions of the pharmaceutically acceptable salts, are used. The solutions of the salts of the products according to the invention are especially useful for administration by intramuscular or subcutaneous injection.
25 The aqueous solutions, also comprising solutions of the salts in pure distilled water, may be used for intravenous administration with the proviso that their pH is suitably adjusted, that they are judiciously buffered and rendered isotonic with a sufficient quantity of glucose or sodium chloride and that they are sterilized by heating, irradiation or microfiltration.

- 30 Suitable compositions containing the compounds of the invention may be prepared by conventional means. For example, compounds of the invention may be dissolved or suspended in a suitable carrier for use in a nebulizer or a suspension or solution aerosol, or may be absorbed or adsorbed onto a suitable solid carrier for use in a dry powder inhaler.

- 35 Solid compositions for rectal administration include suppositories formulated in accordance with known methods and containing at least one compound of formula I.

The percentage of active ingredient in the compositions of the invention may be varied, it being necessary that it should constitute a proportion such that a suitable dosage shall be obtained. Obviously, several unit dosage forms may be administered at about the same time. The dose employed will be
5 determined by the physician, and depends upon the desired therapeutic effect, the route of administration and the duration of the treatment, and the condition of the patient. In the adult, the doses are generally from about 0.001 to about 50, preferably about 0.001 to about 5, mg/kg body weight per day by inhalation, from about 0.01 to about 100, preferably 0.1 to 70, more especially 0.5 to 10,
10 mg/kg body weight per day by oral administration, and from about 0.001 to about 10, preferably 0.01 to 1, mg/kg body weight per day by intravenous administration. In each particular case, the doses will be determined in accordance with the factors distinctive to the subject to be treated, such as age, weight, general state of health and other characteristics which can influence
15 the efficacy of the medicinal product.

The products according to the invention may be administered as frequently as necessary in order to obtain the desired therapeutic effect. Some patients may respond rapidly to a higher or lower dose and may find much weaker maintenance doses adequate. For other patients, it may be necessary
20 to have long-term treatments at the rate of 1 to 4 doses per day, in accordance with the physiological requirements of each particular patient. Generally, the active product may be administered orally 1 to 4 times per day. It goes without saying that, for other patients, it will be necessary to prescribe not more than one or two doses per day.

25 Compounds within the scope of the present invention exhibit marked pharmacological activities according to tests described in the literature which tests results are believed to correlate to pharmacological activity in humans and other mammals. The following pharmacological test results are typical characteristics of compounds of the present invention.

30 1. Inhibitory effects of compounds on PDE activity.

1.1 Preparation of PDE isozymes from pig aorta.

The method is described fully by Souness and Scott (Biochem. J., 291, 389-395, 1993). Briefly, aortas of freshly slaughtered pigs are placed in Hepes buffered krebs solution, extraneous tissue on the outside of the aorta is
35 trimmed off and the endothelial layer on the intimal surface is removed by rubbing with a cotton swab. Smooth muscle strips are plucked from the aorta and 25 g are homogenized using a Waring Blender in homogenization buffer

(20 mM Tris/HCl, pH 7.5, 2 mM MgCl₂, 1 mM dithiothreitol, 5 mM EDTA and 1mg/ml aprotinin). The homogenate is further homogenized with an Ultra-Turrax and then centrifuged (3000 g, 5 minutes). The supernatant is removed, and the pellet is sonicated in a small volume (25-50 mL) of homogenization buffer. The sonicate is centrifuged (3000 g, 5 minutes), the pellet discarded and the supernatant is pooled with that from the first centrifugation step. The pooled supernatants are centrifuged (100,000 g, 1 hour), the resulting high-speed supernatant is filtered (0.45 µm) and then applied to a DEAE-trisacryl (IBF) column (50 x 2.44 cm) preequilibrated in column buffer (20 mM Tris/HCl, pH 7.5, 2 mM MgCl₂, 1 mM dithiothreitol, 20 µM TLCK). The column is washed with 500-700 mL of column buffer and PDE activities are eluted with 2 successive linear gradients of NaCl (0-200 mM, 400 mL and 200-300 mM, 200 mL) in column buffer. The fractions in the separated peaks of activity corresponding to the different PDE isozymes are pooled and stored at -20°C in 30% (v/v) ethylene glycol.

1.2 Measurement of PDE activity.

PDE activity is determined by the two-step radioisotopic method of Thompson et al., Adv. Cyclic Nucl. Res., 10, 69-92 (1979). The reaction mixture contains 20 mM Tris/HCl (pH 8.0), 10 mM MgCl₂, 4 mM 2-mercaptoethanol, 0.2 mM EGTA and 0.05 mg of BSA/mL. The concentration of substrate is 1 µM.

The IC₅₀ values for the compounds examined are determined from concentration-response curves in which concentrations range from 0.1 nM to 40 µM.

1.3 Results.

Compounds within the scope of the invention produce up to about 50% inhibition of porcine aortic cyclic AMP-specific phosphodiesterase (PDE IV) at concentrations from about 10⁻⁹ M up to about 10⁻⁵ M, preferably from about 10⁻⁹ up to about 10⁻⁸ M. The compounds of the invention are from about 10,000-fold to about 50-fold more selective for cyclic AMP phosphodiesterase IV than cyclic nucleotide phosphodiesterase types I, III or V.

2. Inhibitory effects of compounds on eosinophil superoxide generation.

2.1 Preparation of guinea-pig eosinophils.

The method is described fully in Souness et al (Biochem. Pharmacol. 42, 937-945, 1991).

2.2 Measurement of superoxide generation.

Superoxide anion generation is determined as the superoxide dismutase inhibitable reduction of p-iodonitrotetrazolium violet (INTV) (Souness et al, Biochem. Pharmacol. 42, 937-945, 1991). Briefly, cells are incubated in 96 well microtitre plates in 0.25 mL of Hanks buffered salt solution (HBSS) containing INTV (0.5mg/mL) plus other additions for 45 minutes at 37°C. The cells are then centrifuged at 500 g for 5 minutes and the supernatant is aspirated. The pellet is solubilized by incubation overnight at room temperature in DMSO containing 0.6 M HCl and the absorbance of the reduced dye is measured at 492 nm. The results are expressed in absorbance units.

2.3 Results.

Compounds within the scope of the invention produce up to about 50% inhibition of superoxide generation from eosinophils harvested from the peritoneal cavities of guinea-pigs at concentrations from about 10^{-8} M to about 10^{-5} M, preferably from about 10^{-8} M up to about 10^{-7} M.

3. Effects of compounds on tracheal smooth muscle contractility.

3.1 Preparation of guinea-pig tracheal strips and contractility studies.

Organ bath studies are performed essentially according to Tomkinson et al (Br. J. Pharmacol. 108 57-61, 1993). Briefly, tracheas are removed from male, Dunkin-Hartley guinea-pigs (400-500 g) are placed in Krebs Ringer Bicarbonate (KRB) solution and fat and connective tissue are dissected away. Epithelium is removed by mechanical abrasion and the tracheal strips are suspended under an applied load, such that they are at their optimal length, derived from preliminary experiments, and equilibrated for 90 minutes, washing at 15 minute intervals.

Cumulative concentration-response curves to spasmogens are constructed and the concentration producing 30% of maximum contraction (EC_{30}) is determined by computerized linear regression analysis. For relaxant studies, tissues are contracted with spasmogens (such as methacholine, histamine, leukotriene D₄) (EC_{30}) and when the response plateaus, PDE inhibitors (10 nM-100 μ M) or vehicle control (DMSO) are added cumulatively. The concentration of relaxant producing 50% inhibition (IC_{50}) of the agonist response is calculated by linear regression. Alternatively, PDE inhibitors, as above, may be added to tissues under basal tone and the concentration producing 50% relaxation (EC_{50}) calculated as above.

3.2 Results.

Compounds within the scope of the invention produce about 50% relaxation of guinea-pig tracheal strips (under basal tone or which had been contracted by treatment with spasmogens) at concentrations from about 5×10^{-9} M to about 10^{-5} M, preferably from about 5×10^{-9} M to about 10^{-7} M.

5 4. In vivo bronchodilator actions of compounds.

4.1 Measurement of bronchodilatation.

Bronchorelaxant activity is measured in in vivo tests in the anaesthetized guinea-pig or rat according to the method described in Underwood et al., Pulm. Pharmacol. **5**, 203-212, (1992) in which the effects on bronchospasm induced by histamine (or other spasmogens such as methacholine or leukotriene D₄) is determined. Nebulized aerosols generated from aqueous solutions of compounds of the invention are each administered for one minute to the anaesthetized animals. Alternatively, dry powder formulations made up from compounds of the invention and lactose are blown into the airways of the anaesthetized guinea-pigs or rats by the method described in Underwood et al., J. Pharm. Methods, **26**, 203-210, 1991.

4.2 Results.

Compounds within the scope of the invention produce from about 30% up to about 90% decrease in bronchospasm when administered at effective doses of about 4 to about 1000 $\mu\text{g/kg}$, preferably about 4 to about 50 $\mu\text{g/kg}$, without any significant effect on blood pressure.

5. In vivo actions of compounds on antigen (ovalbamin)-induced eosinophilia in guinea-pigs.

5.1 Treatment of animals and measurement of eosinophil numbers.

2.5 Male Dunkin-Hartley guinea-pigs weighing 200-250 g are sensitized using 10 μg ovalbumin in 1 mL of a 100 mg/mL suspension of aluminium hydroxide, i.p.

Sensitized guinea-pigs are anaesthetised and dry powder formulations of PDE inhibitors or lactose are administered (i.t.) into the airways. In some cases PDE inhibitors are administered orally. 23 hours later the procedure is repeated and 60 minutes later the guinea-pigs are challenged with nebulised saline or ovalbumin (1% in saline) for 15 seconds. 24 hours after challenge the guinea-pigs are killed and the lungs are lavaged with warm saline. Total and differential cell counts are made.

3.5 5.2 Results.

Compounds within the scope of the invention, administered one hour before challenge, inhibit by at least 50% ovalbumin-induced eosinophilia in

guinea-pigs which is measured 24 hours after challenge, at oral doses of about 1 to about 50 mg/kg, preferably about 1 to 10 mg/kg and inhaled doses of about 4 to 1000 µg/kg, preferably 4 to 50 µg/kg.

6 In Vitro Inhibitory Effects on TNF-α Release by Human Monocytes.

5 The effects of compounds on TNF-α production by human peripheral blood monocytes (PBMs) are examined as follows:

6.1. Preparation of blood leukocytes.

10 Blood is drawn from normal donors, mixed with dextran, and the erythrocytes allowed to sediment for 35 minutes at 37°C. Leukocytes are fractionated by centrifugation through a discontinuous (18, 20 and 22%) metrizamide gradient. The mononuclear cell fraction comprising 30-40% PBMs is suspended in HBSS and stored at 4°C until use.

6.2. Measurement of TNF-α.

15 Cells from the PBM-rich metrizamide fraction are spun down (200 g for 10 minutes at 20°C), resuspended at 10^6 PBMs/mL of medium; RPMI 1640 containing 1%v/v FCS, 50 U/mL penicillin and 50 mg/mL streptomycin (Gibco, U.K.), then plated out in 96 well plates at 2×10^5 cells/ well. The medium (200 µL) is changed to remove any non-adherent cells and the remaining, adherent PBMs left in the incubator overnight (18 hours). One hour prior to
20 challenge, the medium is changed to that containing compound for test or drug vehicle. Control treatments and compounds for test are assayed in quadruplicate wells. Compounds are tested within the concentration range of 3×10^{-10} M to 3×10^{-6} M. Medium (50 µL) with or without 10ng/ml LPS (E. Coli, 055 B5 from Sigma, U.K.) is then added. The incubation is then
25 continued for a further 4 hours. Cell supernatants are removed for storage at -20°C.

TNF-α levels in cell supernatants are quantified using a standard sandwich ELISA technique. ELISA plates (Costar, U.K.) are coated overnight at 4°C with 3 mg/mL polyclonal goat anti-human TNF-α antibody (British
30 Biotechnology, U.K.) in pH 9.9 bicarbonate buffer. Rabbit polyclonal anti-human TNF-α antiserum (Janssen Biochimica, Belgium) at 1/500 dilution is used as the second antibody and polyclonal goat anti-rabbit IgG horseradish peroxidase (Calbiochem, U.S.A.) at 1/8000 dilution is used as the detection antibody. Color development is measured by absorbance at 450 nm using a
35 Titertek plate reader.

TNF-α levels are calculated by interpolation from a standard curve using recombinant human TNF-α (British Biotechnology U.K.)(0.125-8 ng/mL).

Data (log-conc. vs. log-resp) are fitted by linear regression ($p > 0.99$) using a Multicalc (Wallac Pharmacia, U.K.) software program. Basal $\text{TNF-}\alpha$ levels are less than 100 pg/mL whilst LPS stimulation of the PBMs increases $\text{TNF-}\alpha$ levels to 3-10 ng/mL.

5 6.3 Results.

Compounds within the scope of the invention produce 50% inhibition of LPS-induced $\text{TNF-}\alpha$ release from human PBMs at concentrations within the range of about 10^{-9} M to about 10^{-6} M., preferably about 10^{-9} M to about 10^{-8} M.

1 0 7. Inhibitory effects of compounds on antigen-induced bronchoconstriction in the conscious guinea-pig.

7.1. Sensitisation of guinea-pigs and measurement of antigen - induced bronchoconstriction.

Male, Dunkin-Hartley guinea-pigs (550-700 g) are sensitized as above.

1 5 Specific airways resistance (S_{Raw}) is measured in conscious animals by whole body plethysmography using a variation of the method of Pennock et al., (J. Appl. Physiol., 46 ,399, 1979). Test compounds or vehicle (lactose carrier) are instilled into the airways as dry powders through a metal gavage needle. 30 minutes later, the animals are injected with mepyramine (30 mg/kg i.p.) to
2 0 prevent anaphylactic collapse and placed into the plethysmography chambers where S_{Raw} is determined at 1 minute intervals. Resting S_{Raw} is then determined. Animals are challenged with an aerosol of ovalbumin and S_{Raw} is determined every 5 minutes for 15 minutes.

7.2. Results.

2 5 Compounds within the scope of the invention inhibit antigen-induced bronchoconstriction by up to 80% at doses of between about 1 to about 1000 $\mu\text{g/kg}$ (i.t.), preferably about 1 to about 20 $\mu\text{g/kg}$ (i.t.).

8. Inhibitory effects of compounds on serum $\text{TNF-}\alpha$ levels in LPS - challenged mice.

3 0 8.1. Treatment of animals and measurement of murine $\text{TNF-}\alpha$.

Female Balb/c mice (age 6-8 weeks, weight 20-22 g from Charles River, U.K.) in groups of five or more animals are dosed p.o. with compounds suspended in 1.5% (w/v) carboxymethyl cellulose then challenged after a minimum period of 30 min with 30 mg of LPS i.p. After 90 min the animals are
3 5 killed by CO_2 asphyxiation and bled by cardiac puncture. Blood is allowed to clot at 4°C , centrifuged (12,000 g for 5 minutes) and serum taken for $\text{TNF-}\alpha$ analysis.

TNF- α levels are measured using a commercially available murine TNF- α ELISA kit, purchased from Genzyme (Cat. no. 1509.00), as recommended by the manufacturer. Values for TNF- α are calculated from a recombinant murine TNF- α standard curve.

5 8.2 Results.

Compounds within the scope of the invention inhibit LPS-induced serum TNF- α at doses between about 10 and about 10,000 mg/kg, preferably about 10 to about 250 μ g/kg.

The value of the compounds of the invention is enhanced by their very
10 low mammalian toxicity levels.
